Department of Rheumatology  
Henri Mondor University Hospital  
Créteil, France

I am a rheumatologist with a specialization in osteoarthritis and my research activities are focused on both fundamental and clinical aspects of this field. On the clinical side, I work mainly on local treatments for osteoarthritis and particularly on PRP injections. In terms of basic research, I am currently interested in the characterization of glycosaminoglycans from PRP and synovial fluid and their interactions with platelet-released growth factors but also their effects on chondrocyte and synovial cell homeostasis.

I was a founding member of GRIIP, and I led the development of recommendations on contraindications to PRP injections in musculoskeletal pathologies.
